DESCRIPTION
The 2300 System conditions and amplifies low-level signals to high-level outputs for multiple-channel, simultaneous dynamic recording and display on external devices.

Among its features, each 2310B Module includes a built-in power supply, active filtering, two simultaneous outputs, playback mode, wide frequency response, and voltage injection bridge balance.

Up to ten 2310B Modules can be mounted in a Model 2350 Rack Adapter, or up to four modules in a Model 2360B Portable Enclosure, or a single 2310B can serve as a stand-alone unit using the 2315-A20 Line Cord and Stabilizer.

The 2310B Modules may be interchanged between the 2350 Rack Adapter and the 2360B Portable Enclosure to best satisfy testing requirements.

MODEL 2310B SIGNAL CONDITIONING AMPLIFIER
The 2310B Conditioner/Amplifier Modules accept inputs from strain gages, load/pressure/DC displacement transducers, potentiometers, RTDs and nickel temperature sensors, without any internal modification.

Controls on the 2310B are arranged in sections, permitting easy setup. Clearly marked push-button and single-purpose switches minimize the possibility of operator error during use. With the exception of the playback switch, all operational and monitor controls are on the front panel. Switches for selecting remote sense and specific shunt calibration configurations are located on the printed circuit board inside the unit.

- Calibration: Momentary two-position switches, ±A and ±B, control shunt calibration levels; 4-point
- LED Display: Set up indicator for amplifier balance, bridge balance and for monitoring the output polarity.
- Filter Section: Push-button controls for activating appropriate low- and high-pass active filters.
- Electronic Bridge Balance Section: Three-position switch—OFF, ON, RESET—for electronic bridge balance, auto ranging up to ±25,000 μV with nonvolatile zero storage; yellow light indicates high-range operation or over range condition.
- Vernier trim control is used to refine bridge balance when desired.
- AC IN: Capacitive coupling in the amplifier eliminates static component of the signal.
- Bridge Excitation: ON-OFF switch for removing bridge excitation from the strain gage or transducer for noise documentation.
- Amplifier Balance: Adjusts amplifier offset.
- Excitation Level: Twelve-position switch; values arranged for doubling power with each step, with one 0.2 to 7 VDC continuously variable.
- Amplifier Gain Selection: Continuously variable potentiometer (1.0 to 11.0) plus push-button course gain multipliers control amplifier gain; direct-reading.
- Battery Test: Momentary push button determines battery level for bridge zero storage.
- Main Power: Turns unit on/off; LED pilot light.
- Pin Jocks: Monitoring of Excitation, Unamplified Input, Amplified Output.
